Installing Oxo Synth2 on Windows

Oxo Synth2 for Windows is not code-signed, so Microsoft Defender SmartScreen shows a blue "Windows protected your PC" screen the first time you run the installer.

This is not a virus warning: it only means the file has no publisher certificate Microsoft recognises. If you downloaded the installer from https://oxo-music.com/, it is safe to continue. You can also check the file with your own antivirus.

Click "More info", then "Run anyway" (see below), and the installer opens normally.

Manual install (advanced users):

If you prefer not to run the installer, copy the whole OxoSynth2.vst3 folder into C:\Program Files\Common Files\VST3\. Copying files will not show the SmartScreen screen. Use one method or the other, not both: two copies of the plug-in in different folders can confuse your DAW.
